Coastal Wind Link – 5 Sewaren/Deans Twin Collector (Final)

General Information

Proposing entity name	PSEGRT
Does the entity who is submitting this proposal intend to be the Designated Entity for this proposed project?	No
Joint proposal ID	5
Company proposal ID	Coastal Wind Link – PSEG & Orsted
PJM Proposal ID	871
Project title	Coastal Wind Link – 5 Sewaren/Deans Twin Collector (Final)
Project description	The Sewaren/Deans 400kV Collector is an offshore transmission solution designed to deliver up to 2800 MW of clean, reliable OSW energy to the State of New Jersey. The Project is comprised of two (2) HVDC systems. The Project's offshore converter platforms (OCPs) are designed to serve a total of 2800 MW of OSW (offshore wind) generation from lease areas in the NY Bight. The Project's POIs are located at PSE&G's Sewaren Switching Station and PSE&G's Deans Substation. The Project will use a High Voltage (HV) system based on HVDC Voltage Source Converter (VSC) technology. Each HVDC system will consist of an OCP, a single HVDC export cable system (all elements bundled together into a single marine corridor), and an onshore HVDC converter. The OCP includes a 275kV AC system containing (5) feeders, (2) shunt reactors, (2) 275kV/400kV transformers, and a ±320kV HVDC converter. The two (2) OCPs are linked via 275kV Interlink cables. The onshore converter substation (OnSS) will have a ±400kV HVDC converter system, (3) 400/500kV single phase transformers, breakers, disconnects and a 230kV cable termination structure at Sewaren and a 500kV cable termination structure at Deans. Upon award of the project to the Project team, a project company ("Coastal Wind Link") will be formed as a joint venture between PSEGRT and Orsted NATH and will be the Designated Entity for the project.
Email	Raymond.DePillo@pseg.com
Project in-service date	12/2030
Tie-line impact	Yes
Interregional project	No

Is the proposer offering a binding cap on capital costs?	Yes
Additional benefits	1) The selection of the POI was based on a comprehensive analysis of station headroom and network upgrades in order to determine the optimal POI for future phases of OSW generation. 2) PSEG investigated 200+ properties to site an onshore converter station. The Project team has secured exclusive rights on property to site the converter station. 3) The Project team has obtained detailed site information on the selected landing location including the location of existing utilities and cables to inform landfall design and is in ongoing discussions with the landowner to determine optimal site layout and secure property rights. 4) Optimization of UG route considered mileage, permitting ease, and critical crossings. Field visits allowed PSEG's underground transmission experts to advance route design and estimates. 5) Design of the subsea cable route incorporated feedback from the NJDEP and USACE, seabed conditions, shipping lanes, fishing areas, crossings with existing cables, construction concerns, known UXO areas, and known areas of wrecks. Site investigation experience off the coast of New Jersey has allowed the team to mature route design prior to detailed surveying. 6) The Project team has met with various agencies to discuss permitting scenarios for this first-of-a-kind offshore transmission system. A comprehensive permitting plan has been created to fast-track project execution, and the team has prepared the IHA and ROW/RUE applications necessary. 7) The team worked with leading OEMs to design a symmetrical monopole system. The project is interlink-capable, offering reliability benefits to NJ's future offshore transmission system, while lowering OREC costs, as curtailment risk is reduced.

Project Components

1. S1 400kV Sewaren POI Upgrades
2. S2 400kV Sewaren AC Tie Line
3. S3 400kV Sewaren Onshore Converter
4. S4 400kV Sewaren Offshore/Onshore HVDC Cable
5. S5 400kV Sewaren Offshore Converter
6. D1 Deans POI Upgrades
7. D3 Deans Onshore Converter
8. D4 Deans Offshore/Onshore HVDC Cable
9. D5 Deans Offshore Converter
10. Interlink-SD Sewaren/Deans Interlink (HS-21 to HS-22) #1
11. Interlink-SD Sewaren/Deans Interlink (HS-21 to HS-22) #2
12. D2 Deans AC Tie Line R1

Substation Upgrade Component

Component title	S1 400kV Sewaren POI Upgrades
Project description	Provide attachment facilities for Sewaren to accommodate an injection off 1400MW of offshore wind energy
Substation name	Sewaren Switching Station
Substation zone	PSE&G
Substation upgrade scope	To bring up to 1400 MW of offshore wind energy into Sewaren Switching Station, the existing 230-kV A-Frame structure will be upgraded to house a tri-bundled conductor. This will require modifications involving the existing 230-kV A-Frames, which will be reinforced for the extra loading. (Refer to Appendix B for the Sewaren Switching Station POI one line and bus plan arrangement). PSEG would be required to design and construct the 230-kV modifications to accommodate the offshore wind power injection. Connection to Sewaren would be via 230kV strain bus

Transformer Information

None

New equipment description	PSE&G would be required to design and construction modifications of the existing A-Frame, 230-kV overhead strain bus to 3 conductors per phase. New 230kV SF6 AC breaker, disconnect switches and Current Transformers will be installed Please see Appendix B for the full equipment list
Substation assumptions	The switching station is currently a five bay breaker and a half configuration with five 230-kV lines and a spare position in bus section 7. The site requires expansion due to additional 230-kV incoming lines as part of the network upgrades. However, the station can expand the breaker and half arrangement farther north, where the old 138-kV station and the retired generation collector bus used to be located.
Real-estate description	The scope associated with the POI upgrades can be located all on existing PSE&G property. Please refer to the proposal section 5 for the real estate description.
Construction responsibility	PSEG
Benefits/Comments	

Component Cost Details - In Current Year $

Engineering & design	Competitive

Permitting / routing / siting	Competitive
ROW / land acquisition	Competitive
Materials & equipment	Competitive
Construction & commissioning	Competitive

Overheads & miscellaneous costs	Competitive
Contingency	Competitive
Total component cost	$18,066,725.00
Component cost (in-service year)	$21,627,461.00

Greenfield Transmission Line Component

Component title	S2 400kV Sewaren AC Tie Line	
Project description	Construct a 230kV OH AC tie-line between the onshore converter station and the 230kV Sewaren Switching Station	
Point A	Sewaren DC/AC Converter Station	
Point B	Sewaren Switching Station	
Point C		
	Normal ratings	**Emergency ratings**
Summer (MVA)	1400.000000	1400.000000
Winter (MVA)	1400.000000	1400.000000
Conductor size and type	230kV triple 1590 ACSR	
Nominal voltage	AC	
Nominal voltage	230 kV	

Line construction type	Overhead
General route description	The AC connection between the two facilities will consist of a short (approximately 250 feet or less) 230-kV AC overhead transmission line (overhead strain bus connection)
Terrain description	The connection is within the existing switching station property
Right-of-way width by segment	The Sewaren OnSS will be located adjacent to the Sewaren POI (i.e., the Sewaren Switching Station). As a result, the AC connection between the two facilities will consist of a short (approximately 250 feet or less) 230-kV AC overhead transmission line (overhead strain bus connection).
Electrical transmission infrastructure crossings	Electrical infrastructure crossings may be required depending on final line routing and design.Electrical infrastructure crossings may be required depending on final line routing and design.
Civil infrastructure/major waterway facility crossing plan	The extent of detail civil infrastructure planning will be determined pending final design.
Environmental impacts	The PSEG/Ørsted Team conducted an assessment of anticipated permits associated with the Project and supported the evaluation of siting, routing, and development scenarios throughout the Project development process. The permitting and environmental assessments included a review of Federal, regional, State, and local regulatory requirements that could potentially impact each of the individual Project components. These assessments reflect in-depth analyses of the proposed Project plan reviewed with available GIS data, a detailed understanding of applicable regulations, and significant professional experience with projects of similar scope and in this same locality. As part of this Project analyses, potential Project sites and routes were discussed with a myriad group of experienced planning, engineering and construction professionals to find a competitive route that minimized environmental and built environment concerns. Please see Appendix K.
Tower characteristics	Overhead strainbus will be installed between a-frames at Sewaren switching station and the onshore converter station
Construction responsibility	Proposer

Winter (MVA)	1400.000000	1400.000000

Environmental assessment

Overview - The Project Team conducted an assessment of anticipated permits associated with the Sewaren route and have supported the evaluation of routing and development scenarios throughout the project development process. The permitting and environmental assessments have included a review of Federal, regional, State, and local regulatory requirements that could potentially impact each of the individual project scenarios. For onshore facility siting and routing, the Project Team evaluated land ownership with a dedicated approach to minimize disturbance to Green Acres, wetlands, flood hazard areas, known historic and cultural sites, threatened and endangered species, known contaminated sites, and known sensitive receptors. The site is located in a Flood Zone will require design to meet FEMA+1. No Wetlands and no impacts to threatened and endangered species. Please see Appendix K.

Outreach plan	The team has developed a comprehensive communication process for all transmission projects to adequately keep stakeholders engaged at all levels, including public officials, municipal officials, environmental organizations, business customers, residents, etc. This process ensures constant and detailed communication efforts throughout all phases of a project, including pre, mid and post-construction activities. This Combined Team is currently working together on the Ocean Wind project and combined has actual permitting experience for the offshore wind environment and vast New Jersey-based permitting experience with firsthand relationships across the Federal and State government. The team has been able to gain a thorough understanding of the various concerns typically raised by either directly impacted or peripheral parties, such as disruptions during construction, concerns around electromagnetic fields (EMF), property value, traffic impacts and other potential matters. However, more importantly, the team has been able to identify solutions for each potential concern, and has strong insight on how to mitigate public apprehension and construction impacts. The team has developed a specific outreach plan tailored towards the Offshore Wind Transmission Project that will be implemented to foster the success of the project. The team's strategy outreach plan uses multiple and concurrent communication methods to reach and inform and address diverse audiences and knowledge levels. A variety of communication tactics will be used, tailored to each stakeholder audience and its particular communication style and preference. Messages and actions will be customized for each stakeholder group. Communications will be designed to provide adequate information to stakeholders. All timings of these communications will be aligned with the project’s schedule pre- and post-bid submission.
Land acquisition plan	The subject property is a portion of the former power generating station for PSEG Power and current Sewaren Switching Station located along the Port Reading Reach of the Arthur Kill. This property is owned by a PSEG affiliate, PSEG Power, LLC. PSEG Power is a deregulated entity, and the Project Team has reached agreement with its sister company to secure rights to the necessary real estate if granted an award. The Project Team is confident that the unique rights available to us ensure that the Projects are constructible if awarded by PJM and the BPU.

Greenfield Transmission Line Component

Component title	S4 400kV Sewaren Offshore/Onshore HVDC Cable	
Project description	See Section 3 of Proposal	
Point A	OCP HS-21	
Point B	Sewaren DC/AC Converter Station	
Point C		
	Normal ratings	**Emergency ratings**
Summer (MVA)	1400.000000	1400.000000
Winter (MVA)	1400.000000	1400.000000
Conductor size and type	"Onshore - ±400-kV 2500mm^2 single-circuit XLPE HVDC cable Offshore: ±400-kV 2500mm^2,3000mm^2 XLPE submarine"	
Nominal voltage	DC	
Nominal voltage	±400-kV	
Line construction type	Underground, Submarine	
General route description	"""Onshore - Approximately 6.3 miles extending principally beneath public road ROWs from Keasbey, through Perth Amboy Township, to the new converter station in Sewaren Offshore - Approximately 92.1 miles in route length in a direction generally north, then west from HS-21 through the Atlantic Ocean then Raritan Bay and into the Raritan River to meet the shore"	

Terrain description	Offshore: The HVDC submarine route was carefully selected to avoid challenging geotechnical conditions, physical obstructions, and known significant environmental features, while efficiently siting the offshore cable system. Onshore: Along almost all of the route, the onshore HVDC cables will be buried beneath public roads.
Right-of-way width by segment	"Offshore: Approximately 92.1 miles (HS-21 to the RA-1 Landfall). 60' typical cable width (disturbed) Onshore: 6.3 mile length installed UG with 5'-0" Minimum Width for duct banks"
Electrical transmission infrastructure crossings	Electrical infrastructure crossings may be required depending on final line routing and design.
Civil infrastructure/major waterway facility crossing plan	The installation process will typically involve the following tasks: - Trench Excavation/Duct Bank Installation. The cable trench will be excavated to dimensions of approximately 6 to 10 feet deep and 5 to 7 feet wide (for trench depths requiring shoring to stabilize the sidewalls). - Splice Vault Excavation/Installation. At intervals along the cable route, areas will be excavated for the installation of below-grade of reinforced-concrete splice vaults, within which cable sections will be connected. - Proofing/Cable Installation. After successful proofing, the transmission cables will be installed and spliced within the vaults. Special Crossings - Along the HVDC and AC cable routes, where open trenching is not viable, special crossing techniques will be used to install the cable while minimizing environmental impacts. - Jack & Bore (J&B). This method will be used to install the cable system beneath certain infrastructure or other features that cannot be open cut (e.g., a railroad or highway). - Bridge Attachment. This method is applicable in areas where an open-cut installation is not practical and the cable system can instead be attached to an existing bridge, thereby effectively spanning features such as water resources or highway underpasses. - Horizontal Directional Drilling (HDD). This method is typically used to install cable where open cut is not feasible (usually when crossing water bodies or highways), where there is no suitable bridge to attach to, and where J&B is not feasible (water body or too long of a crossing). Please see section 4.4 in the proposal for further information
Environmental impacts	The PSEG/Ørsted Team conducted an assessment of anticipated permits associated with the Project and supported the evaluation of siting, routing, and development scenarios throughout the Project development process. The permitting and environmental assessments included a review of Federal, regional, State, and local regulatory requirements that could potentially impact each of the individual Project components. These assessments reflect in-depth analyses of the proposed Project plan reviewed with available GIS data, a detailed understanding of applicable regulations, and significant professional experience with projects of similar scope and in this same locality. This Project was designed to minimize impacts to physical resources on shore, in large party by undergrounding the HVDC cable system primarily within road ROWs. . This approach would result in only temporary impacts to wetlands and water bodies with no offshore and no permanent wetlands impacts expected. Please see Appendix K
Tower characteristics	N/A, the route will be entirely UG

Environmental assessment	Overview - The Project Team conducted an assessment of anticipated permits associated with the Sewaren route and have supported the evaluation of routing and development scenarios throughout the project development process. The permitting and environmental assessments have included a review of Federal, regional, State, and local regulatory requirements that could potentially impact each of the individual project scenarios. For offshore facility siting and routing, the Project Team reviewed available GIS data for the presence of marine mammals, fishing and shipping lanes, benthic habitat, anchorage areas, known obstructions, existing cables, and bathymetry. Please see Appendix K.

Outreach plan	The team has developed a comprehensive communication process for all transmission projects to adequately keep stakeholders engaged at all levels, including public officials, municipal officials, environmental organizations, business customers, residents, etc. This process ensures constant and detailed communication efforts throughout all phases of a project, including pre, mid and post-construction activities. This Combined Team is currently working together on the Ocean Wind project and combined has actual permitting experience for the offshore wind environment and vast New Jersey-based permitting experience with firsthand relationships across the Federal and State government. The team has been able to gain a thorough understanding of the various concerns typically raised by either directly impacted or peripheral parties, such as disruptions during construction, concerns around electromagnetic fields (EMF), property value, traffic impacts and other potential matters. However, more importantly, the team has been able to identify solutions for each potential concern, and has strong insight on how to mitigate public apprehension and construction impacts. The team has developed a specific outreach plan tailored towards the Offshore Wind Transmission Project that will be implemented to foster the success of the project. The team's strategy outreach plan uses multiple and concurrent communication methods to reach and inform and address diverse audiences and knowledge levels. A variety of communication tactics will be used, tailored to each stakeholder audience and its particular communication style and preference. Messages and actions will be customized for each stakeholder group. Communications will be designed to provide adequate information to stakeholders. All timings of these communications will be aligned with the project’s schedule pre- and post-bid submission.
Land acquisition plan	The project will complete a Right of Use / Right of Way (RUE/ROW) application with BOEM to be granted authorization to place the offshore collector platform in the area between Hudson South A and Hudson South B lease areas. The platforms will be placed outside of the lease areas such that additional authorization from the lease holders will not be necessary.

Substation Upgrade Component

Component title	D1 Deans POI Upgrades
Project description	Provide attachment facilities for Deans to accommodate an injection off 1400MW of offshore wind energy
Substation name	Deans Switching Station
Substation zone	PSEG
Substation upgrade scope	To bring up to 1400 MW of offshore wind energy into Deans Switching Station an additional 500-kV position is required to the existing 500kV Breaker-and-a-half at Deans. (Refer to Appendix B for the substation one line and bus plan arrangement.)

Transformer Information

None

New equipment description	(6)-500KV Cable terminations (2)-500KV H-frame Structures (3)-500KV CCVT’s (3)-500KV Lightning Arresters (4)-500KV 2000A Disc. Sw. (1)-500KV 2000A Disc. Sw. w/ground switch (6)-500KV strain bus assemblies w/2 shield wires (2)-500KV 2000A Circuit Breaker (3)-500KV Metering units (30)-500KV single phase bus supports
Substation assumptions	Deans Switching Station occupies a portion of a 52 acre site in South Brunswick, New Jersey. It is currently a 500kV three bay breaker-and-a-half bay and a 230kV four bay breaker-and-a-half configuration. The station has three 500-kV lines, and four 230-kV Lines. Because of the size of the site, the substation can be expanded to accommodate additional bays, as needed for the clean wind energy AC connection, without the need to acquire additional property. Please see appendix B for station drawings
Real-estate description	The substation can be expanded to accommodate additional bays, as needed for the clean wind energy AC connection, without the need to acquire additional property. An agreement may need to be reached for an easement where Coastal Wind Link will install the 500kV cable termination structure, A-Frame.

This method will be used to install the cable system beneath certain infrastructure or other features that cannot be open cut (e.g., a railroad or highway). - Bridge Attachment. This method is applicable in areas where an open-cut installation is not practical and the cable system can instead be attached to an existing bridge, thereby effectively spanning features such as water resources or highway underpasses. - Horizontal Directional Drilling (HDD). This method is typically used to install cable where open cut is not feasible (usually when crossing water bodies or highways), where there is no suitable bridge to attach to, and where J&B is not feasible (water body or too long of a crossing). Please see section 4.4 in the proposal for further information
Environmental impacts	The PSEG/Ørsted Team conducted an assessment of anticipated permits associated with the Project and supported the evaluation of siting, routing, and development scenarios throughout the Project development process. The permitting and environmental assessments included a review of Federal, regional, State, and local regulatory requirements that could potentially impact each of the individual Project components. These assessments reflect in-depth analyses of the proposed Project plan reviewed with available GIS data, a detailed understanding of applicable regulations, and significant professional experience with projects of similar scope and in this same locality. This Project was designed to minimize impacts to physical resources on shore, in large party by undergrounding the HVDC cable system primarily within road ROWs. . This approach would result in only temporary impacts to wetlands and water bodies with no offshore and no permanent wetlands impacts expected. Please see Appendix K
Tower characteristics	N/A. The cable will be underground and submarine.
Construction responsibility	Proposer

Benefits/Comments

Component Cost Details - In Current Year $

Engineering & design	Competitive
Permitting / routing / siting	Competitive
ROW / land acquisition	Competitive
Materials & equipment	Competitive
Construction & commissioning	Competitive
Construction management	Competitive
Overheads & miscellaneous costs	Competitive
Contingency	Competitive
Total component cost	$869,629,555.65
Component cost (in-service year)	$1,088,401,589.00

Greenfield Substation Component

Component title	D5 Deans Offshore Converter
Project description	
Substation name	Deans Offshore Converter Platform (OCP HS-22)
Substation description	"The OCP that will feed the Deans OnSS will be located adjacent to the Hudson South BOEM lease area in the New York Bight. The OCP is made up of two main components: the substructure and the topside. The substructure—the lattice structure that is fixed to the seabed—is commonly referred to as the jacket. The topside is the steel enclosure on top of the jacket that contains the electrical equipment."
Nominal voltage	DC
Nominal voltage	±400-kV

Transformer Information

	Name	**Capacity (MVA)**	
Transformer	Converter Transformer T1	795	
	High Side	**Low Side**	**Tertiary**
Voltage (kV)	413	275	23
	Name	**Capacity (MVA)**	
Transformer	Converter Transformer T2	795	
	High Side	**Low Side**	**Tertiary**
Voltage (kV)	413	275	23

Major equipment description	The OCP will house the equipment necessary to receive AC electrical power from the connected wind farm, convert it to HVDC and export it to the onshore station via HVDC sub-sea and land cable. The main HV components include AC switchgear, transformers, DC converter towers, DC reactors and DC switchgear. Please refer to Appendix B for the full equipment list

	Normal ratings	**Emergency ratings**
Summer (MVA)	1400.000000	1400.000000
Winter (MVA)	1400.000000	1400.000000

Environmental assessment	Overview - The Project Team conducted an assessment of anticipated permits associated with the Deans route and have supported the evaluation of routing and development scenarios throughout the project development process. The permitting and environmental assessments have included a review of Federal, regional, State, and local regulatory requirements that could potentially impact each of the individual project scenarios. For offshore facility siting and routing, the Project Team reviewed available GIS data for the presence of marine mammals, fishing and shipping lanes, benthic habitat, anchorage areas, known obstructions, existing cables, and bathymetry. Please see Appendix K.

Outreach plan	The team has developed a comprehensive communication process for all transmission projects to adequately keep stakeholders engaged at all levels, including public officials, municipal officials, environmental organizations, business customers, residents, etc. This process ensures constant and detailed communication efforts throughout all phases of a project, including pre, mid and post-construction activities. This Combined Team is currently working together on the Ocean Wind project and combined has actual permitting experience for the offshore wind environment and vast New Jersey-based permitting experience with firsthand relationships across the Federal and State government. The team has been able to gain a thorough understanding of the various concerns typically raised by either directly impacted or peripheral parties, such as disruptions during construction, concerns around electromagnetic fields (EMF), property value, traffic impacts and other potential matters. However, more importantly, the team has been able to identify solutions for each potential concern, and has strong insight on how to mitigate public apprehension and construction impacts. The team has developed a specific outreach plan tailored towards the Offshore Wind Transmission Project that will be implemented to foster the success of the project. The team's strategy outreach plan uses multiple and concurrent communication methods to reach and inform and address diverse audiences and knowledge levels. A variety of communication tactics will be used, tailored to each stakeholder audience and its particular communication style and preference. Messages and actions will be customized for each stakeholder group. Communications will be designed to provide adequate information to stakeholders. All timings of these communications will be aligned with the project's schedule pre- and post-bid submission.
Land acquisition plan	The project will complete a Right of Use / Right of Way (RUE/ROW) application with BOEM to be granted authorization to place the offshore collector platform in the area between Hudson South A and Hudson South B lease areas. The platforms will be placed outside of the lease areas such that additional authorization from the lease holders will not be necessary.

Greenfield Transmission Line Component

Component title	Interlink-SD Sewaren/Deans Interlink (HS-21 to HS-22) #1	
Project description		
Point A	OCP HS-21	
Point B	OCP HS-22	
Point C		
	Normal ratings	**Emergency ratings**
Summer (MVA)	450.000000	450.000000
Winter (MVA)	450.000000	450.000000
Conductor size and type	1800mm2 Submarine XLPE Cable	
Nominal voltage	AC	
Nominal voltage	275	
Line construction type	Submarine	
General route description	See Section 3 and Appendix A.	
Terrain description	See Section 3 and Appendix A.	
Right-of-way width by segment	See Section 3 and Appendix A.	
Electrical transmission infrastructure crossings	No crossings exist.	

Civil infrastructure/major waterway facility crossing plan	No crossings exist.
Environmental impacts	The PSEG/Ørsted Team conducted an assessment of anticipated permits associated with the Project and supported the valuation of siting, routing, and development scenarios throughout the Project development process. The permitting and environmental assessments included a review of Federal, regional, State, and local regulatory requirements that could potentially impact each of the individual Project components. These assessments reflect in-depth analyses of the proposed Project plan reviewed with available GIS data, a detailed understanding of applicable regulations, and significant professional experience with projects of similar scope and in this same locality. As part of this Project analyses, potential Project sites and routes were discussed with a myriad group of experienced planning, engineering and construction professionals to find a competitive route that minimized environmental and built environment concerns. Greenfield Transmission Line Component

Component title	D2 Deans AC Tie Line R1

Project description	Construct a 500kV UG AC tie-line between the onshore converter station and the 500kV Deans Switching Station	
Point A	Deans Converter Station	
Point B	Deans Switching Station	
Point C		
	Normal ratings	**Emergency ratings**
Summer (MVA)	1400.000000	1400.000000
Winter (MVA)	1400.000000	1400.000000
Conductor size and type	2500mm2 Conductors (2 cables per phase)	
Nominal voltage	AC	
Nominal voltage	500	
Line construction type	Underground	
General route description	The AC route will be installed underground in road ROWs along Fresh Ponds road and along the adjacent overhead ROW between the Deans converter station and Deans substation	
Terrain description	In paved roads and unpaved grass ROW	
Right-of-way width by segment	Approximately 1,500 feet along Fresh Ponds road ROW and 3,600 feet along the overhead ROW. Entire length is approximately 4'-11" width.	
Electrical transmission infrastructure crossings	Electrical infrastructure crossings may be required depending on final line routing and design	
Civil infrastructure/major waterway facility crossing plan	The extent of detail civil infrastructure planning will be determined pending final design.	

Environmental impacts	The PSEG/Ørsted Team conducted an assessment of anticipated permits associated with the Project and supported the evaluation of siting, routing, and development scenarios throughout the Project development process. Financial Information

Capital spend start date 06/2022

Construction start date 11/2024

Project Duration (In Months) 102

Cost Containment Commitment

Cost cap (in current year) $4,806,660,425.00

Cost cap (in-service year) $5,951,644,604.00

Components covered by cost containment

1. S2 400kV Sewaren AC Tie Line - Proposer
2. S3 400kV Sewaren Onshore Converter - Proposer
3. S4 400kV Sewaren Offshore/Onshore HVDC Cable - Proposer
4. S5 400kV Sewaren Offshore Converter - Proposer
5. D3 Deans Onshore Converter - Proposer
6. D4 Deans Offshore/Onshore HVDC Cable - Proposer
7. D5 Deans Offshore Converter - Proposer
8. Interlink-SD Sewaren/Deans Interlink (HS-21 to HS-22) #1 - Proposer
9. Interlink-SD Sewaren/Deans Interlink (HS-21 to HS-22) #2 - Proposer
10. D2 Deans AC Tie Line R1 - Proposer

Cost elements covered by cost containment

Engineering & design	Yes
Permitting / routing / siting	Yes
ROW / land acquisition	Yes
Materials & equipment	Yes
Construction & commissioning	Yes
Construction management	Yes
Overheads & miscellaneous costs	Yes
Taxes	No
AFUDC	No
Escalation	No

Additional Information	Project is offering a guaranteed availability date of December 31st 2029 for the first HVDC system, subject to the terms in the cost commitment legal language. Construction Cost Cap Amount will be adjusted for inflation beyond existing expectations based on changes in the Handy-Whitman Index; Cost Cap may increase or decrease based on changes to Handy-Whitman Index. Construction Cost Cap Amount will be adjusted based on changes in foreign exchange rates; Cost Cap may increase or decrease based on changes in foreign exchange rates. Construction Cost Cap may be adjusted based on changes to in taxes or duties that differ from assumptions. Specific cost cap commitments can be found in Section 1.7 of the SAA submittal and the attached legal language.
Is the proposer offering a binding cap on ROE?	Yes
Would this ROE cap apply to the determination of AFUDC?	Yes
Would the proposer seek to increase the proposed ROE if FERC finds that a higher ROE would not be unreasonable?	No
Is the proposer offering a Debt to Equity Ratio cap?	Yes
Additional cost containment measures not covered above	Project is offering a guaranteed availability date of December 31st 2029 subject to the terms in the cost commitment legal language for the first HVDC system in this proposal. Project has proposed specific cost cap language in the SAA submittal, and is also submitting proposed legal language in the PJM planner. As an overview, the Project is capping costs which it can control, and excluding costs that it cannot. Excluded costs broadly fall into the following categories: Foreign exchange costs in excess of assumptions, inflation and tax costs in excess of assumptions, and excess costs driven by delays in government and regulatory approvals. As specified in the submitted legal language, the Project team would need to demonstrate to the BPU how these changes impacted the price and schedule of the Proposal before any adjustments would be made. Changes caused by delay, inaction, or lack of reasonable diligence on the part of the Project team would not be reason for a cost cap or schedule adjustment.
